

Perception Testbed Fog Chamber Data Documentation

November 1, 2021

Experiment Name: baseline08
Start Time: 13-May-2021 08:37:41.334
Duration: 00:01:35.475
Target: USAF-1951
Target Distance: 45.6692 meters
Target Temperature: 60 C
Environment Notes: No fog present during baseline tests.
No environmental data available.

File Information:
Visible Spectrum: 952 Images
Longwave Infrared: 956 Images
LIDAR: 118 Data & Images

1 Data Snapshot: baseline08

The following images describe the variation in data during the experiment.

2 Experiment Setup and Equipment Specifications

2.1 Perception Testbed Hardware

A novel testbed, featuring a visible spectrum camera, a longwave infrared camera, and a lidar was built and transported to the Fog Chamber at Sandia National Laboratories for fog chamber testing. The perception testbed features the following equipment:

- FLIR BlackFly - Visible Range Camera
- FLIR Boson – Long wave infrared thermal camera
- AEye Intelligent LIDAR

2.2 Environment Monitoring Equipment

During fog experiments, the following equipment was used for characterization of the fog and light scattering resulting from the fog:

- Malvern Spraytec instrument with inhalation cell accessory - produces a measurement of fog particle sizes, this information is useful in understanding light scattering.
- Transmissometer – used in measuring the Meteorological Optical Range (MOR) a light emitting diode and camera are used under a static distance to measure the optical effects of the fog.
